

Short Argumentative Essay

The debate over the use of animals in medical research has been ongoing for centuries. On one side, there are those who believe that it is cruel and unethical to use animals as test subjects, while on the other side, there are those who argue that animal testing is necessary for scientific progress. Despite both sides having valid points, I firmly believe that using animals in research should be avoided whenever possible due to its potential for causing harm and suffering.

Body Paragraph 1:

Firstly, it is important to consider the ethical implications of using animals in medical experiments. Animals have feelings and emotions just like humans do; they experience pain and distress when subjected to invasive procedures or unnatural environments. As such, subjecting them to unnecessary harm or distress can be seen as a form of cruelty that should not be tolerated. Additionally, some researchers may attempt to justify their actions by claiming that their work has beneficial results for humans but this does not negate the fact that innocent creatures were harmed in order for these discoveries to be made.

Body Paragraph 2:

For another thing, animal testing can lead to inaccurate results due to differences between species' reactions and responses towards treatments or chemicals. In many cases, animal testing yields results that cannot be applied to humans due to differences in physiology,

biochemistry, and gene expression. Therefore, animal testing can lead to treatments or medications that may not work for humans or even cause harm as a result of incorrect information being obtained from the tests.

Body Paragraph 3:

Finally, there are now alternatives available that make use of non-animal models such as computer models or cell culture systems; these provide more accurate and reliable results while simultaneously eliminating any need to subject animals to unnecessary harm. With all this taken into consideration it is clear why animal testing should be avoided whenever possible; doing so ensures that ethical considerations are respected and that reliable data is obtained without causing any undue harm.

Conclusion: In conclusion, animal testing has been a contentious issue for many years and there are valid arguments on both sides of the debate. However, I firmly believe that animal testing should be avoided whenever possible due to its potential for causing harm and suffering as well as inaccurate results which could result in ineffective treatments or medications. Furthermore, advancements in technology have now made it possible to obtain reliable data without the need to use animals in experiments; this makes the argument against using animals even stronger. Therefore, we must do our best to ensure that animal testing is minimized wherever possible so as to respect these creatures' rights and welfare while still advancing scientific discovery.
